Week 5B\_2: Discrete event simulation (4):  
Generating random numbers

<https://powcoder.com>  
Add WeChat powcoder

# This lecture

---

- Discrete event simulation
  - Week 4B: How to structure the simulation
  - Weeks 5A, 5B\_1: Statistical analysis
- This lecture **Assignment Project Exam Help**
  - Background on random numbers and how they are generated
  - How to generate random numbers of **any** probability distribution
  - Reproducibility **Add WeChat powcoder**
- Motivation
  - The Python random library can generate random numbers from many probability distributions but sometimes you may need a distribution that the library does not have

# Random number generator in C

- In C, the function *rand()* generates random integers between 0 and RAND\_MAX
- E.g. The following program generates 10 random integers:

```
#include <stdio.h>
#include <stdlib.h>

int main ()
{
    int i;

    for (i = 0; i < 10; i++)
        printf("%d\n",rand());

    return;
}
```

Assignment Project Exam Help

<https://powcoder.com>  
Let us generate 10,000 random integers using rand() and see how they are distributed  
Add WeChat powcoder

This C file “genrand1.c” is available from the course web site.

# Distribution of 10000 entries from rand()

Sort into 50 bins

If the numbers are really uniformly distributed, we expect 200 numbers in each bin.

The numbers are almost uniformly distributed

# LCG

- The random number generator in C is a Linear Congruential Generator (LCG)
- LCG generates a sequence of integers  $\{Z_1, Z_2, Z_3, \dots\}$  according to the recursion

$$Z_k = a Z_{k-1} + c \pmod{m}$$

where  $a$ ,  $c$  and  $m$  are integers

- By choosing  $a$ ,  $c$ ,  $m$ ,  $Z_1$  appropriately, we can obtain a sequence of seemingly random integers
- If  $a = 3$ ,  $c = 0$ ,  $m = 5$ ,  $Z_1 = 1$ , LCG generates the sequence 1, 3, 4, 2, 1, 3, 4, 2, ...
- *Fact:* The sequence generated by LCG has a cycle of  $m-1$
- We must choose  $m$  to be a large integer
  - For C,  $m = 2^{31}$
- The proper name for the numbers generated is *pseudo-random numbers*

# Seed

- LCG generates a sequence of integers  $\{Z_1, Z_2, Z_3, \dots\}$  according to the recursion

$$Z_k = a Z_{k-1} + c \pmod{m}$$

where  $a$ ,  $c$  and  $m$  are integers

- The term  $Z_1$  is call a seed
- By default, C also uses 1 as the seed and it will generate the same random sequence
- However, sometimes you need to generate different random sequences and you can change the seed by calling the function `srand()` before using `rand()`
  - Demo `genrand1.c`, `genrand2.c` and `genrand3.m`
  - *`genrand1.c` – uses the default seed*
  - *`genrand2.c` – sets the seed using command line argument*
  - *`genrand3.c` – sets the seed using current time*

# Uniformly distributed random numbers between (0,1)

---

- With `rand()` in C, you can generate uniformly distributed random numbers in between 1 and  $2^{31}-1$  (= `RAND_MAX`)
  - By dividing the numbers by `RAND_MAX`, you get randomly distributed numbers in (0,1)
- In Python, uniformly distributed random numbers in (0,1) can be generated by `random.random()` or `numpy.random.random()`
  - Both libraries uses the Mersenne Twister random number generator with a period of  $2^{19937}-1$
  - If you use  $10^9$  random number in a second, the sequence will only repeat after  $10^{5985}$  years
- Why are uniformly distributed random numbers important?
  - If you can generate uniformly distributed random numbers between (0,1), you can generate random numbers for any probability distribution

# Random numbers generated by numpy

- 10,000 numbers generated by `numpy.random.random()`
  - Code in `rand_uni.py`

Histogram of  $10^4$  uniformly distributed psuedo-random numbers

# Fair coin distribution

---

- You can generate random numbers between 0 and 1
- You want to use these random numbers to imitate fair coin tossing, i.e.
  - Probability of HEAD = 0.5
  - Probability of TAIL = 0.5
- You can do this using the following algorithm
  - Generate a random number  $u$
  - If  $u < \square$ , output HEAD
  - If  $u \geq \square$ , output TAIL

# A loaded die

- You want to create a loaded die with probability mass function

- The algorithm is:

- Generate a random number  $u$

- If  $u < 0.1$ , output 1

- If  $0.1 \leq u < 0.2$ , output 2

- If  $0.2 \leq u < 0.3$ , output 3

- If  $0.3 \leq u < 0.4$ , output 4

- If  $0.4 \leq u < 0.5$ , output 5

- If  $0.5 \leq u < 0.6$ , output 6

# Cumulative probability distribution

Assignment Project Exam Help

<https://powcoder.com>

Probability that the dice gives a value  $\leq x$

Ex: Can you work out what these levels should be

Add WeChat powcoder

# Comparing algorithm with cumulative distribution

- The algorithm is:

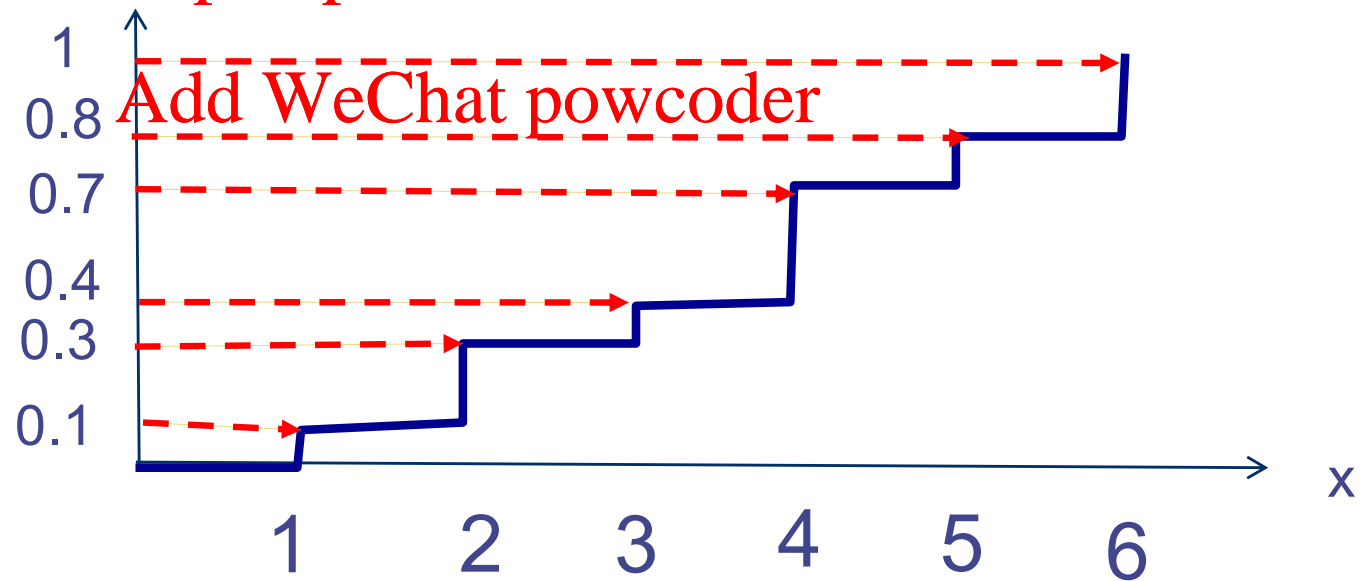

- Generate a random number  $u$
- If  $u < 0.1$ , output 1
- If  $0.1 \leq u < 0.3$ , output 2
- If  $0.3 \leq u < 0.4$ , output 3
- If  $0.4 \leq u < 0.7$ , output 4
- If  $0.7 \leq u < 0.8$ , output 5
- If  $0.8 \leq u$ , output 6

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Probability that the dice gives a value  $\leq x$

Ex: What do you notice about the intervals in the algorithm and the cumulative distribution?

# Graphical interpretation of the algorithm

- The algorithm is:

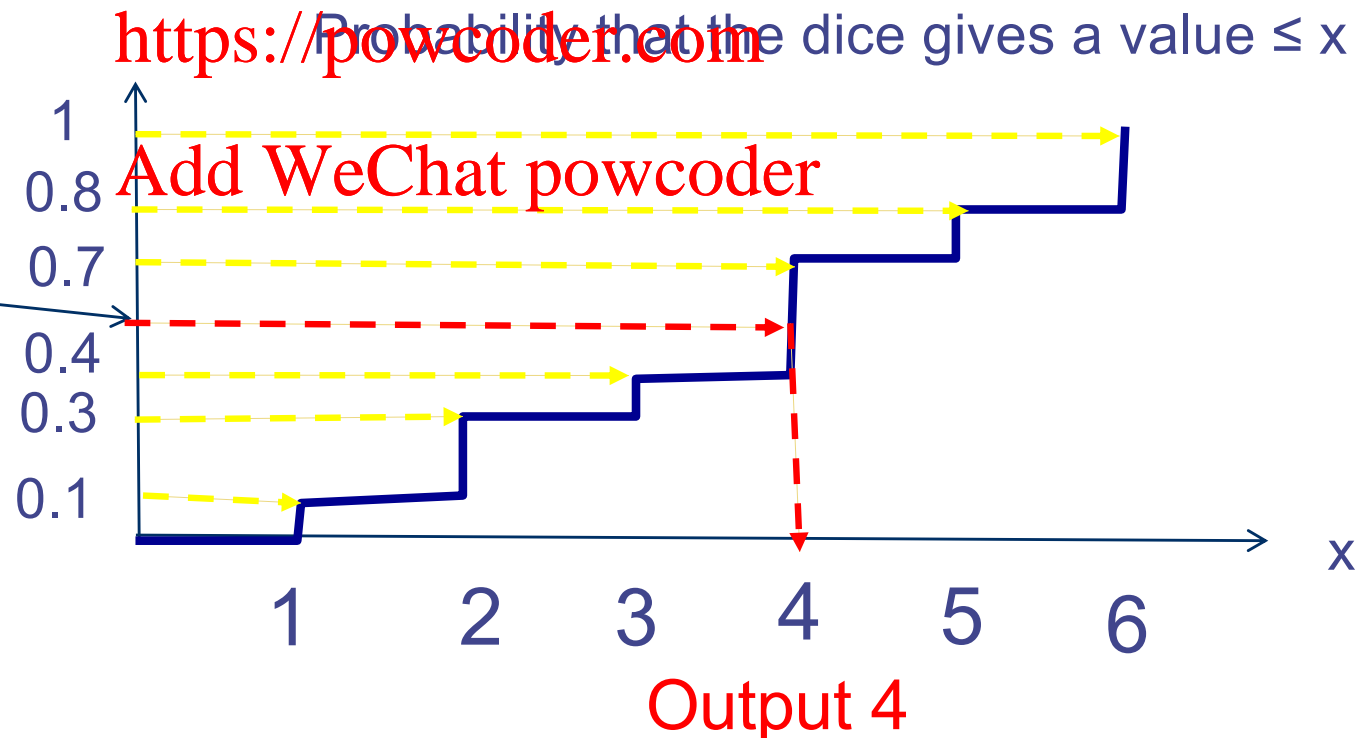

- Generate a random number  $u$
- If  $u < 0.1$ , output 1
- If  $0.1 \leq u < 0.3$ , output 2
- If  $0.3 \leq u < 0.4$ , output 3
- If  $0.4 \leq u < 0.7$ , output 4
- If  $0.7 \leq u < 0.8$ , output 5
- If  $0.8 \leq u$ , output 6

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Ex: Let us assume  $u = 0.5126$ , what should the algorithm output?

# Graphical representation of inverse transform method

- Consider the cumulative density function (CDF)  $y = F(x)$ , showed in the figure below

For this particular  $F(x)$ , if  $u = 0.7$  is generated then  $F^{-1}(0.7)$  is 6.8

# Inverse transform method

---

- A method to generate random number from a particular distribution is the *inverse transform method*
- In general, if you want to generate random numbers with cumulative density function (CDF)  $F(x) = \text{Prob}[X \leq x]$ , you can use the following procedure:
  - Generate a number  $u$  which is uniformly distributed in  $(0,1)$
  - Compute the number  $F^{-1}(u)$
- Example: Let us apply the inverse transform method to the exponential distribution
  - CDF is  $1 - \exp(-\lambda x)$

Assignment Project Exam Help

Add WeChat powcoder

# Generating exponential distribution

- Given a sequence  $\{U_1, U_2, U_3, \dots\}$  which is uniformly distributed in  $(0,1)$
  - The sequence  $-\log(1 - U_k)/\lambda$  is exponentially distributed with rate  $\lambda$
- 
- (Python file hist\_expon.py)
    1. Generate 10,000 uniformly distributed numbers in  $(0,1)$
    2. Compute  $-\log(1-u_k)/2$  where  $u_k$  are the numbers generated in Step 1
    3. The plot shows
      1. The histogram of the numbers generated in Step 2 in 50 bins
      2. The red line show the expected number of exponential distributed numbers in each bin

Histogram of  $10^4$  exponentially distributed psuedo-random numbers

# Reproducible simulation – motivation

---

- You may recall that when we run the simulation `sim_mm1.py`, each simulation run gives a different result because different set of random numbers is used
- Doing simulation is like performing a scientific experiment
- Good science demands reproducibility
  - E.g., If you claim that the mean response time of a simulation run is say 1.3579, other people should be able to reproduce your result

# Reproducible simulation

- In order to realise reproducibility of results, you need to save the state of the random number generator before simulation. If you reuse the setting later, you can reproduce the result
  - The state of the Mersenne Twister plays a similar role to a seed in the generator used by C
- Demo: `sim_mm1.py`

Assignment Project Exam Help

<https://powcoder.com>

```
# obtain setting and save it in a file
rand_state = random.getstate()
pickle.dump( rand_state, open( "rand_state_mm1.p", "wb" ) )
```

Add WeChat powcoder

```
# load the saved setting and apply it
rand_state = pickle.load( open( "rand_state_mm1.p", "rb" ) )
random.setstate(rand_state)
```

# Random number generators in Python

---

- Although both the random and numpy.random libraries use the Mersenne Twister generator, the generator for the libraries are separate
- The numpy.random library
  - You can generate an array of random numbers
  - The functions to get and set the state are `numpy.random.get_state()` and `numpy.random.set_state()`
  - Fewer distributions compared to the random library
