

COMP9334

Capacity Planning for Computer Systems and Networks

Assignment Project Exam Help

Week 4B: <https://powcoder.com> Discrete event simulation (1)

Add WeChat powcoder

Week 4A: Queues with general arrival & service time

- Queues with general inter-arrival and service time distributions

Assignment Project Exam Help

- M/G/1 queue

- Can calculate delay with the Pollaczek formula

<https://powcoder.com>

Add WeChat powcoder

$$W = \frac{\lambda E[S^2]}{2(1 - \rho)}$$

- G/G/1 queue

- No explicit formula, get a bound or approximation

$$W \leq \frac{\lambda(\sigma_a^2 + \sigma_s^2)}{2(1 - \rho)}$$

Analytical methods for queues

- You had learnt how to solve a number of queues analytically (= mathematically) given their
 - Inter-arrival time probability distribution
 - Service time probability distribution
- Queues that you can solve now include M/M/1, M/M/m, M/G/1, M/G/1 with priorities etc.
 - If you know the analytical solution, this is often the most straightforward way to solve a queueing problem
- Unfortunately, *many queueing problems are still analytically intractable!*
- What can you do if we have an analytically intractable queueing problem?

Lectures 4B, 5A, 5B: Discrete event simulation

- For a number of lectures, we look at the topic of using *discrete event simulation for queueing problems*
 - *Simulation is an imitation of the operation of real-life system over time.*

Assignment Project Exam Help

- The topics to be covered are
 - (4B) What are discrete event simulation?
<https://powcoder.com>
 - (4B) How to structure a discrete event simulation?
Add WeChat powcoder
- For 5A and 5B
 - How to choose simulation parameters?
 - How to analyse data?
 - What are the pitfalls that you need to avoid?
 - How to generate pseudo-random numbers for simulation?
 - Reproducibility

Motivating example

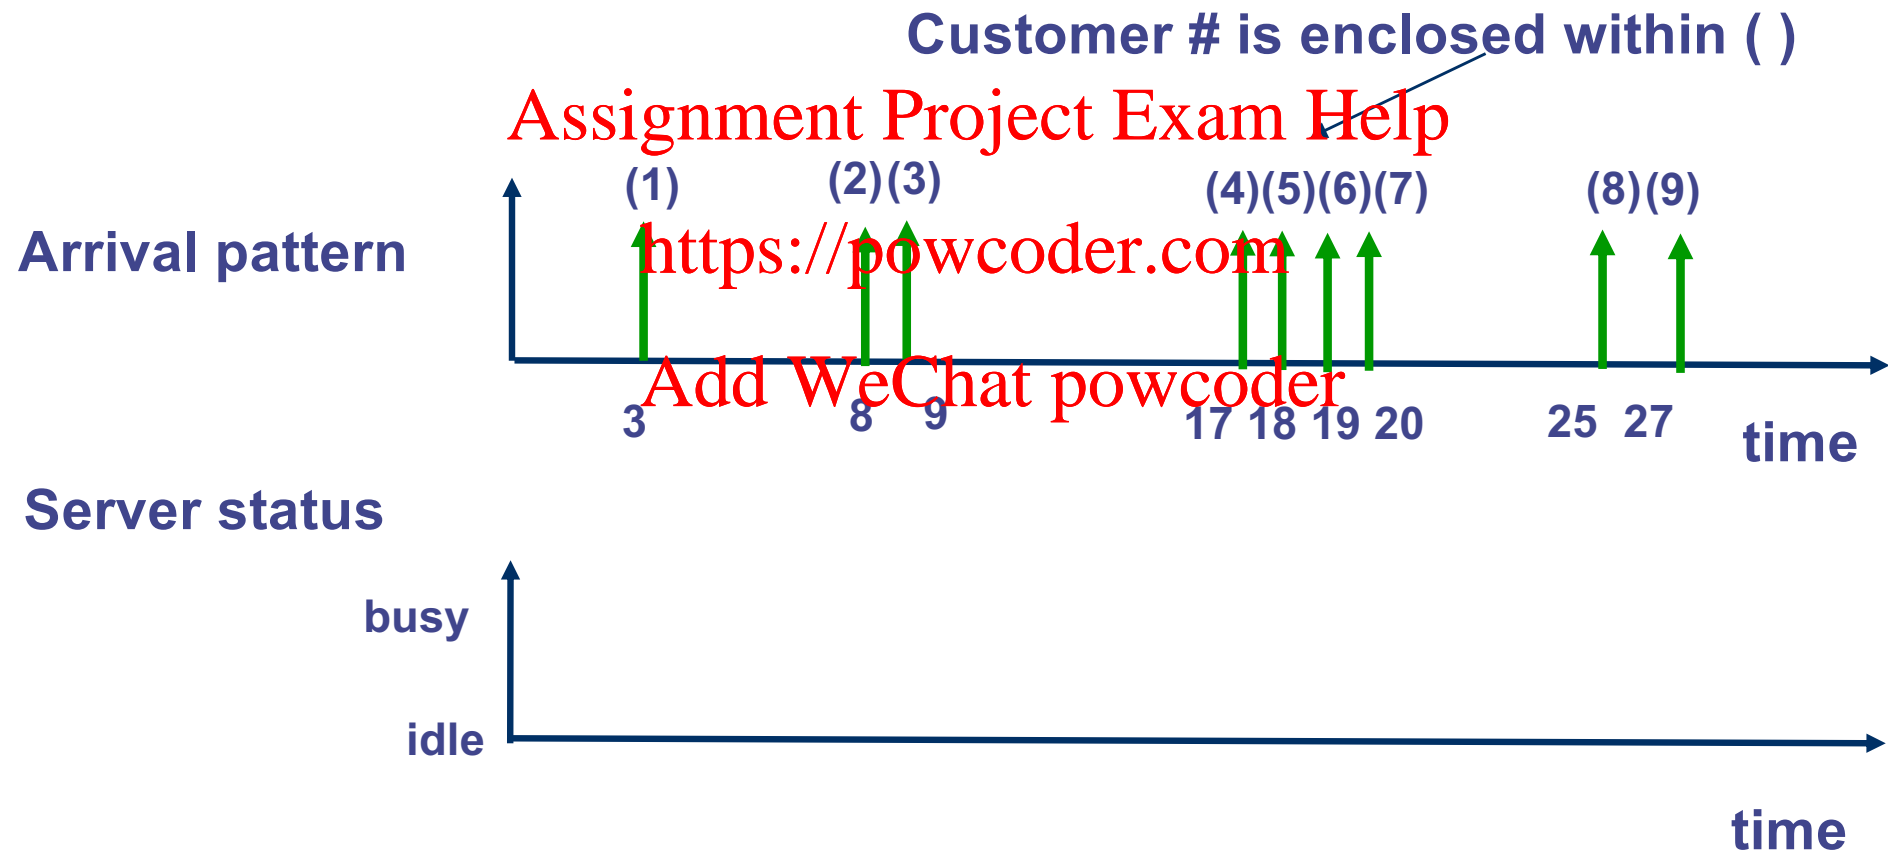

- Consider a single-server queue with only one buffer space (= waiting room)
- If a customer arrives when the buffer is occupied, the customer is rejected.
- Given the arrival times and service times in the table on the right, find
 - The mean response time
 - % of rejected customersAssuming an idle server at time = 0.

Customer number	Arrival time	Service time
1	3	4
2	8	3
3	9	4
4	17	6
5	18	3
6	19	2
7	20	2
8	25	3
9	27	2

Let us try a graphical solution

- In the graphical solution, we will keep track of
 - The status of the server: busy or idle
 - The status of the buffer: occupied or vacant

A graphical solution (To be completed)

Arrival pattern

Server status

Buffer status

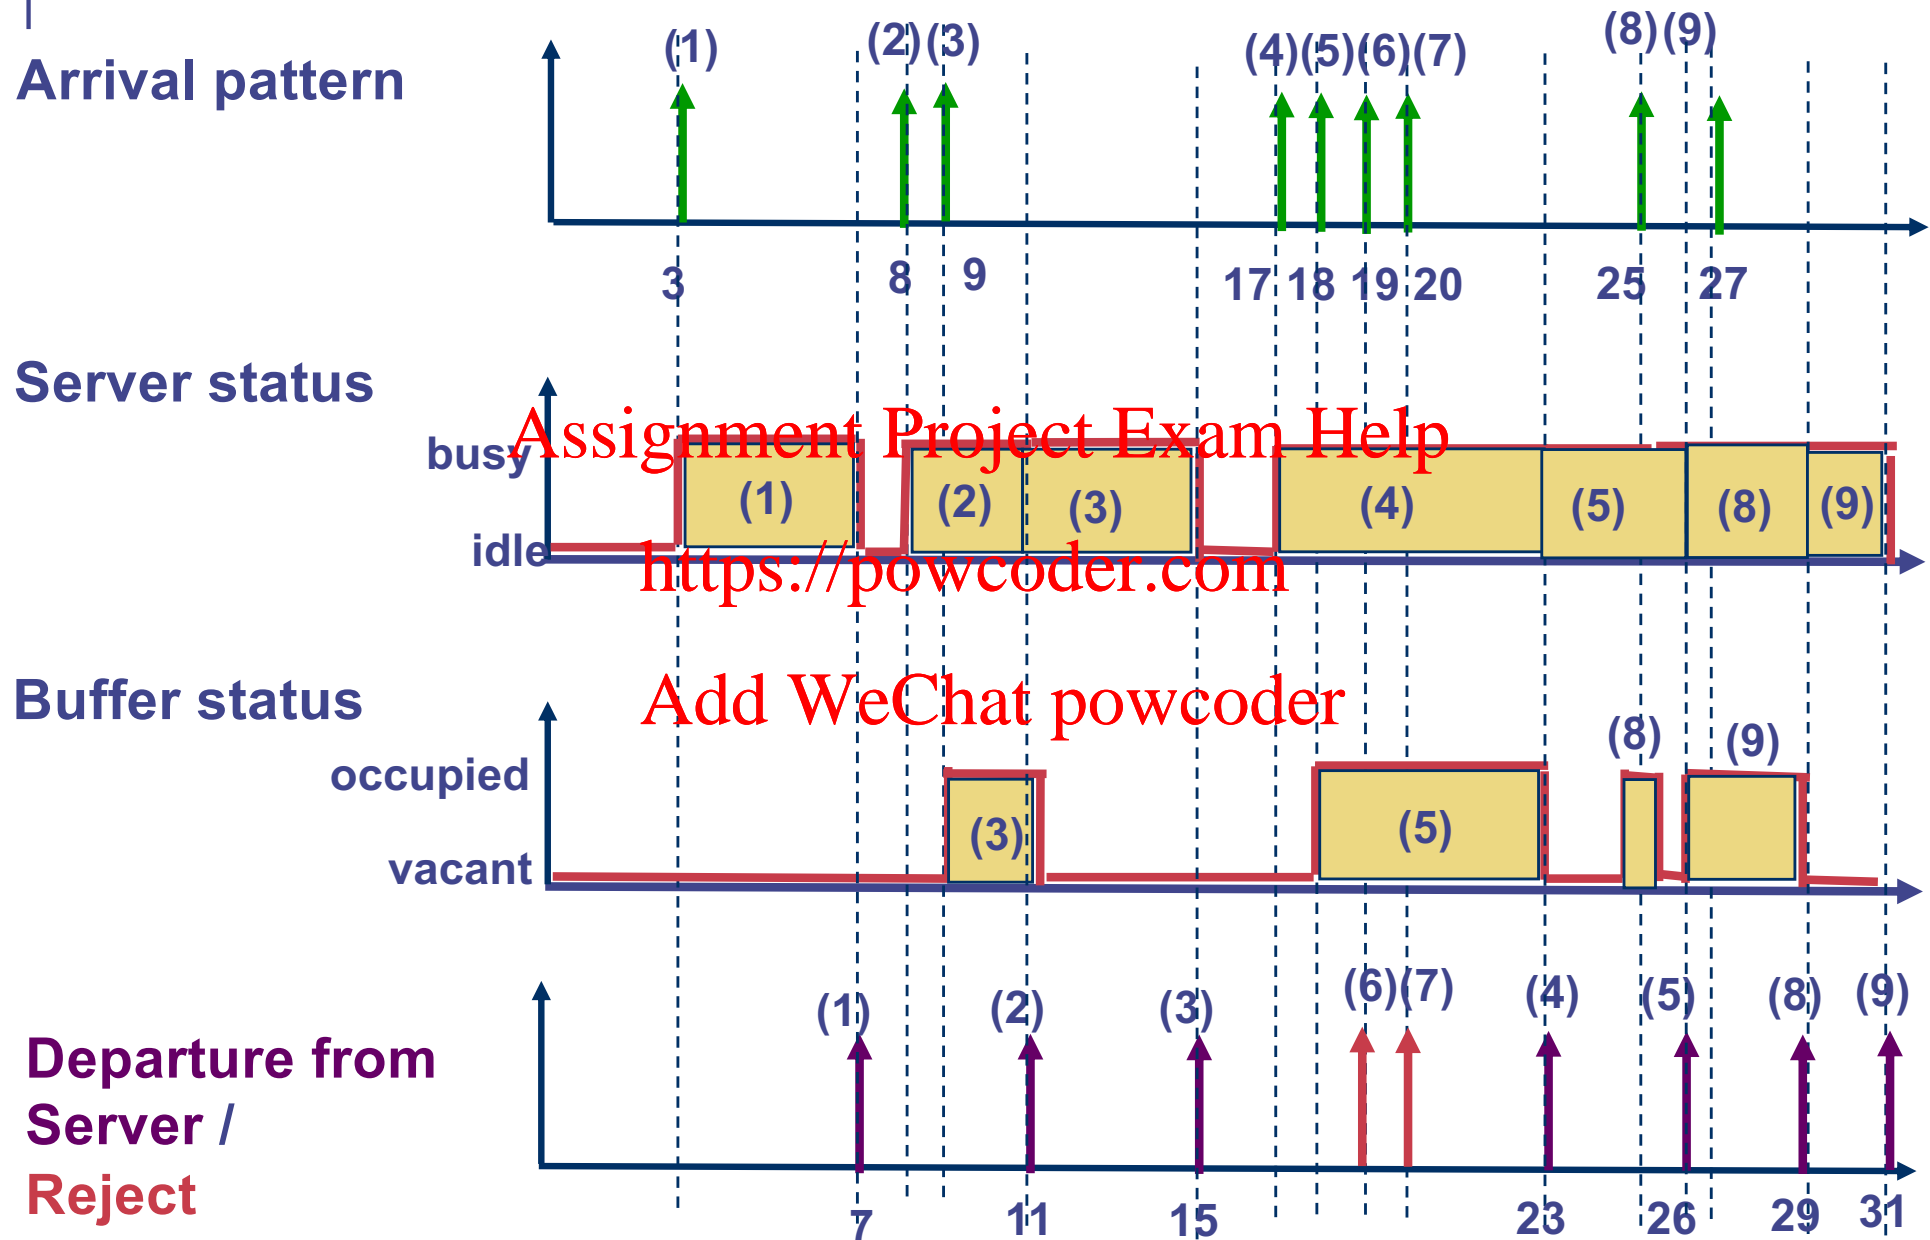

Departure from
Server /

Reject

A graphical solution

Using the graphical solution (1)

Arrival pattern

We can find the response time of each customer & average response time

Assignment Project Exam Help

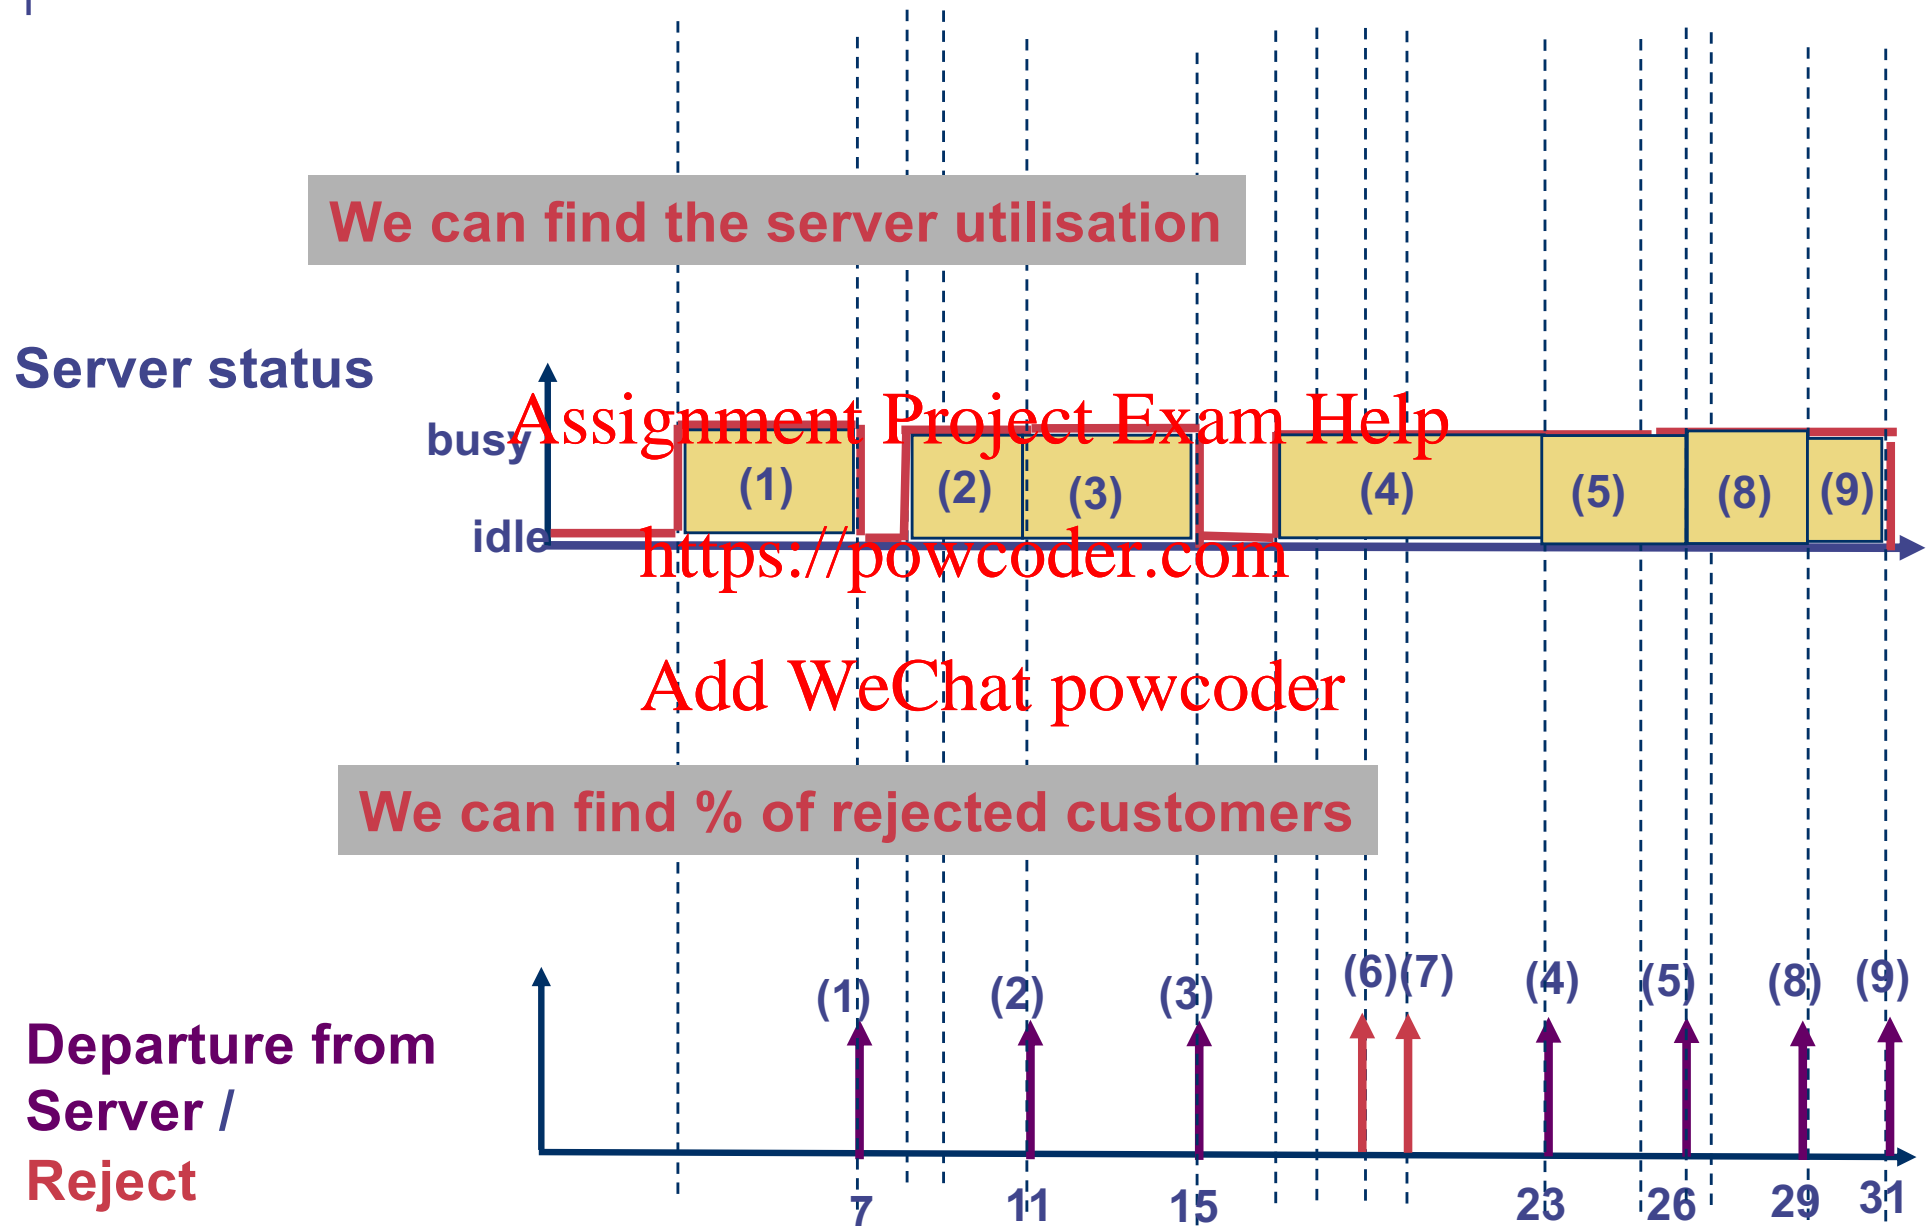

<https://powcoder.com>

Add WeChat powcoder

Departure from Server / Reject

Using the graphical solution (2)

From graphical solution to computer solution (1)

- How can we turn this graphical solution into a computer solution, i.e. a computer program that can solve the problem for us
- We need to keep track of the status of the server and the status of the buffer,
 - This allows us to make decisions
 - E.g. If server is BUSY and buffer is OCCUPIED, an arriving customer is rejected.
 - E.g. If server is BUSY and buffer is VACANT, an arriving customer goes to the buffer.
 - E.g. If server is IDLE, an arriving customer goes to the server
- *What this means:* We need to keep track of the status of some variables in our computer solution.

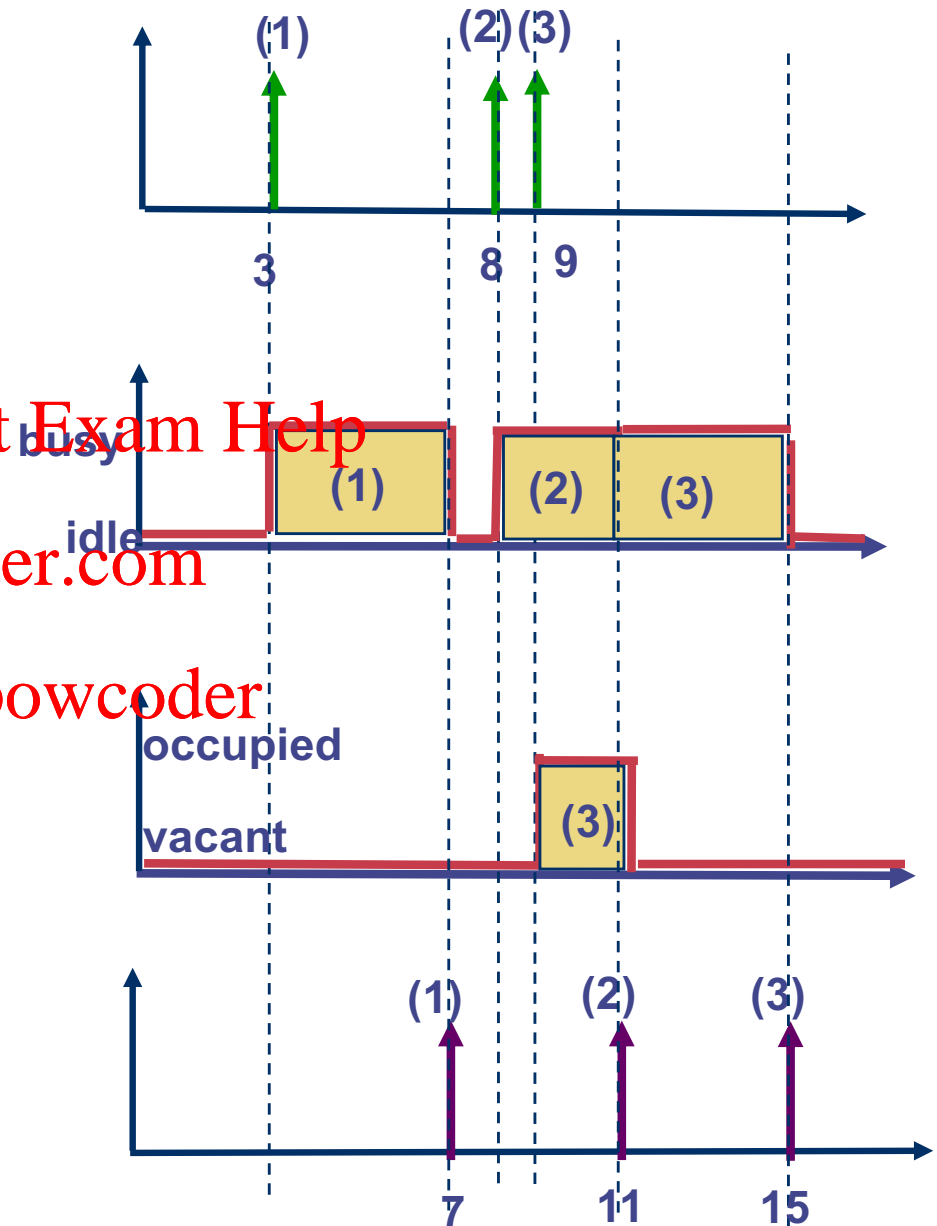

From graphical solution to computer solution (2)

- Observation #1:

- An arriving or departing customer causes the server or buffer status to change

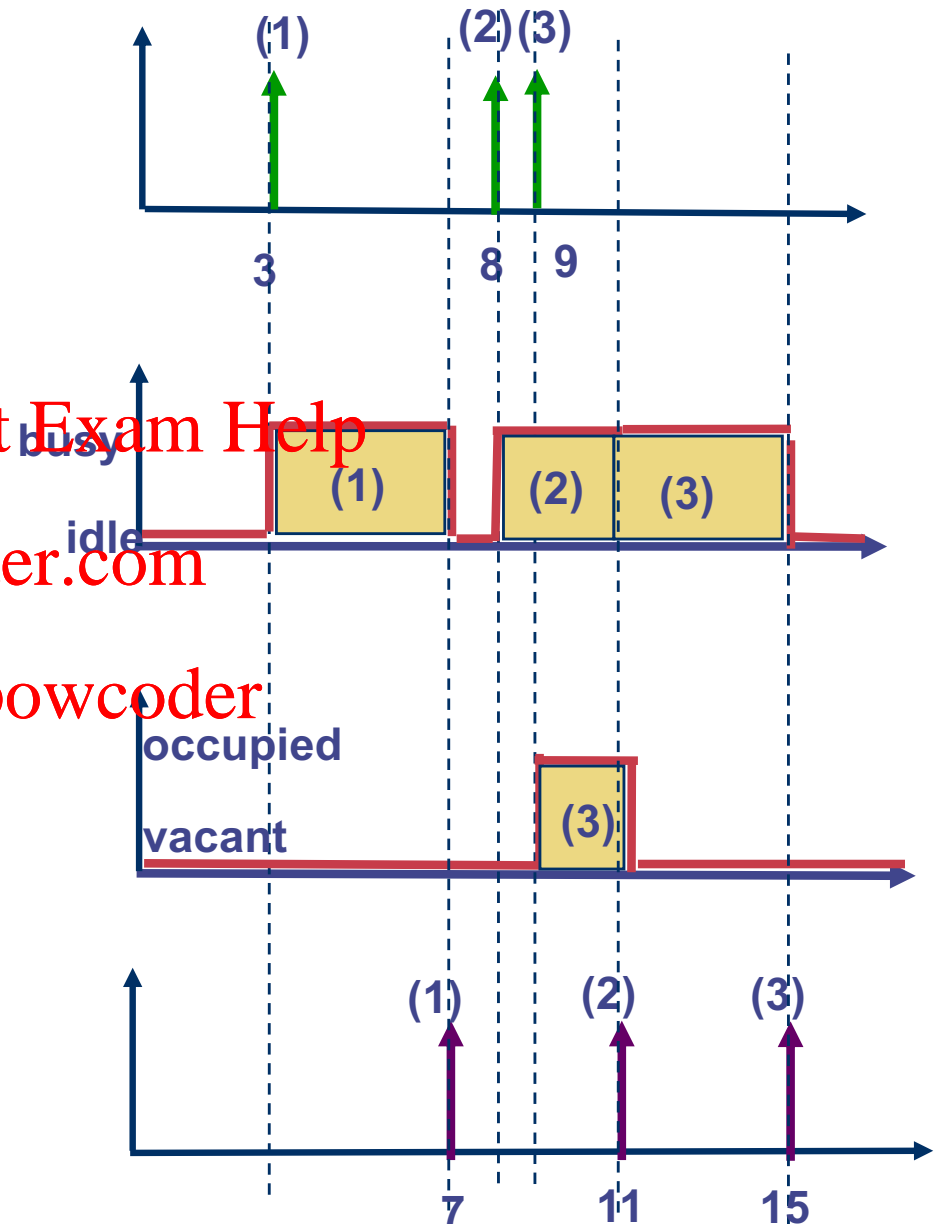

- Examples:

- At time = 3, the arrival of customer #1 causes the server to switch from IDLE to BUSY
- At time = 7, the departure of customer #1 causes the server to switch from BUSY to IDLE
- At time = 9, the arrival of customer #3 causes the buffer to switch from VACANT to OCCUPIED
- Etc.

From graphical solution to computer solution (3)

- Let us call the arrival of a customer or the departure of a customer an **event**
- Observation #2:
 - The status of the server and the status of the buffer remain the same between two consecutive events
- What this means:
 - We need to keep track of the timing of the events
 - Events can cause status transitions
 - In between events, status remain the same

From graphical solution to computer solution (4)

- In our computer solution, we will use a **master clock** to keep track of the current time
- We will advance the master clock from event to event
- In order to see how the computer solution works, let us try it out on paper

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

On paper simulation

- In our simulation, we keep track of a number of variables
 - MC = Master clock
 - Status of
 - Server: 1 = BUSY, 0 = IDLE
 - Buffer: 1 = OCCUPIED, 0 = VACANT
 - Event time:
 - Next arrival event and service time of this arrival
 - Next departure event and arrival time of this departure
 - The (arrival time, service time) of the customer in buffer
 - In order to compute the response time, we keep track of
 - The cumulative response time (T)
 - Cumulative number of customers rejected (R)

MC	Next arrival		Next departure		Server status	Buffer status + customer in buffer	T	R
	Arrival time	Service time	Departure time	Arrival time of this departure				
0	3	4	-	-	0	0	0	0
3	8	3	7	3	1	0	0	0
7	8	3	-	-	0	0	4	0

On paper simulation (To be completed)

MC	Next arrival		Next departure		Server status	Buffer status + Customer in buffer	T	R
	Arrival time	Service time	Departure time	Arrival time of this departure				
0	3	4	-	-	0	0	0	0
3	8	3	7	3	1	0	0	0
7	8	3	-	-	0	0	4	0

Can you continue?

(Arrival time, service time) of the customer in the buffer.

On paper simulation

MC	Next arrival		Next departure		Server status	Buffer status + Customer in buffer	T	R
	Arrival time	Service time	Departure time	Arrival time of this departure				
0	3	4	-	-	0	0	0	0
3	8	3	7	3	1	0	0	0
7	8	3	-	-	0	0	4	0
8	9	4	11	8	1	0	4	0
9	17	6	11	8	1	1	4	0
11	17	6	15	9	1	0	7	0
15	17	6	-	-	0	0	13	0

Can you continue?

(Arrival time, service time) of the customer in the buffer.

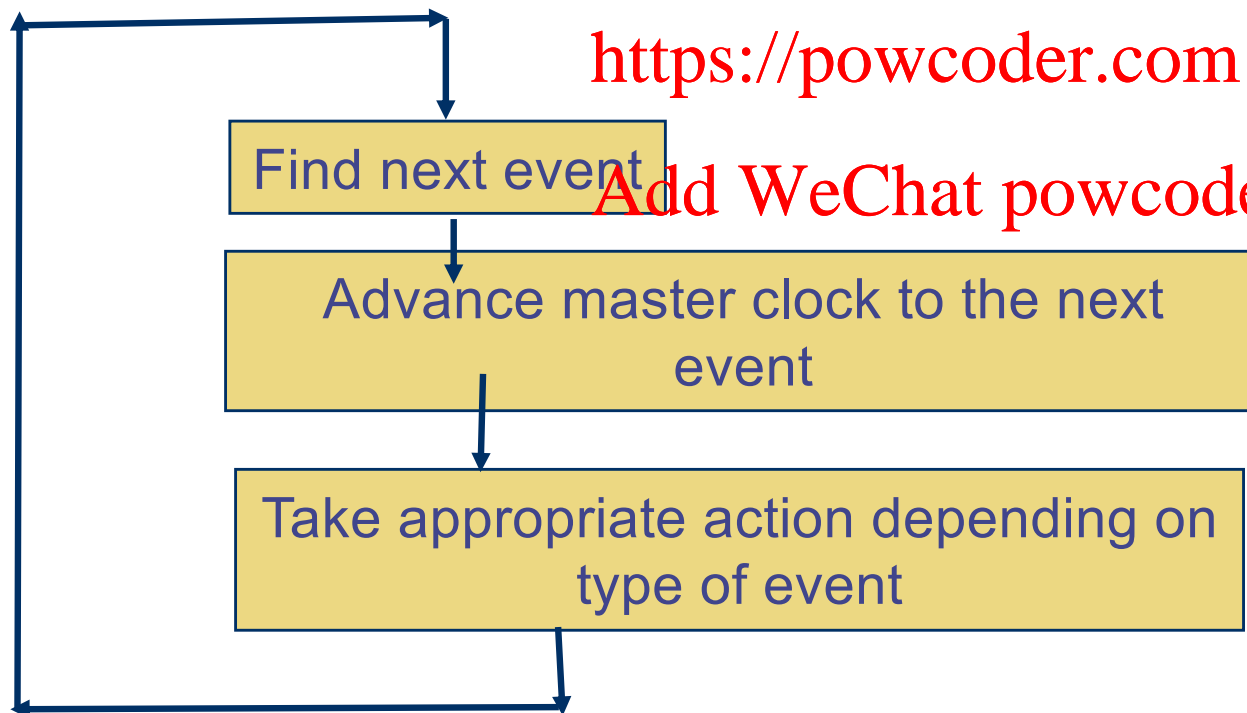

Logic of the program (1)

- At each step, we advance to the next event that will take place

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Handling an arrival event

Three cases according to the server and/or buffer status

Arrival event

Server IDLE
(Buffer VACANT)

- Add a departure event with departure time = current time + service time of the arrival
- Change server status to BUSY

Server BUSY
Buffer VACANT

- Change buffer status to OCCUPIED
- Store the arrival time and service time of this arrival with buffer information

Server BUSY
Buffer OCCUPIED

- Reject this customer
- Increment the cumulative number of rejected customers by one

- Look up the list of arrival to fill in the information for the next arrival event

Handling an departure event

Two cases according to the buffer status

Departure event

- Update the cumulative response time
 - $T \leftarrow T + \text{current time} - \text{arrival time of the departing customer}$

Assignment Project Exam Help

<https://powcoder.com>

Buffer VACANT

Buffer OCCUPIED

- Change server status to IDLE
- Next departure event becomes empty

Add WeChat powcoder

- Update the departure event with information of the customer in the buffer
- Next departure time = current time + service time of the customer in the buffer
- Change buffer status to VACANT

Discrete event simulation

- The above computer program is an example of a discrete event simulation
- It allows you to solve a queueing problem with one server and one buffer space
- You can generalise the above procedure to
 - Multi-server
 - Finite or infinite buffer space
 - Different queueing disciplines
- Let us generalise it to the case of single-server with infinite buffer

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Single server with infinite buffer simulation

- In this case, we will use buffer status to denote the number of customers in buffer
 - Buffer status = 0, 1, 2, 3, ...
- We also need to store all the (arrival time, service time) of all the customers in the buffer
- Compare with the single-server single-buffer case, we only need to change the handling of
 - An arrival event
 - A departing event

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Handling an arrival event

Two cases according to the server status

Arrival event

Server IDLE

- Add a departure event with departure time = current time + service time of the arrival
- Change server status to BUSY

Server BUSY

- Increment number of customers in the buffer by 1
- Store the arrival time and service time of this arrival with buffer information

- Look up the list of arrival to fill in the information for the next arrival

Handling an departure event

Two cases according to the buffer status

Departure event

- Update the cumulative response time
 - $T \leftarrow T + \text{current time} - \text{arrival time of the departing customer}$

Assignment Project Exam Help

<https://powcoder.com>

Buffer = 0

Buffer \neq 0

- Change server status to IDLE
- Departure event becomes empty

- Update the departure event with first customer in the buffer
- Next departure time = current time + service time of the first customer in the buffer
- Delete first customer from buffer
- Decrement number of customers in the buffer by 1

One missing piece

- We know how to write a discrete event simulation program to simulate a single-server queue with infinite buffer
assuming that we have the arrival times and service times
- Where do arrival times and service times come from?
Assignment Project Exam Help
<https://powcoder.com>
- If we want to simulate an M/M/1 queue
Add WeChat powcoder
 - The inter-arrival time is exponentially distributed
 - The service time is exponentially distributed
- We can get the arrival times and service times if we can generate exponentially distributed random numbers

The Python random library

- The library can be used to generate random numbers from many probability distributions
- `random.expovariate()` can be used to generate exponentially distributed random numbers

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
import random
lamb = 2
i1 = random.expovariate(lamb)
i2 = random.expovariate(lamb)
i3 = random.expovariate(lamb)
```

Name ▲	Type	Size	Value
i1	float	1	0.886333566840348
i2	float	1	0.5129872509130181
i3	float	1	0.2597444444294557

Exponential distributed random numbers

```
# To produce 10,000 numbers that are exponentially distributed
lamb = 2
n = 10000
x = []
for i in range(n):
    x.append(random.expovariate(lamb))
```

Assignment Project Exam Help

- Generate 10,000 exponentially distributed number and plot the histogram
- File: hist_random_expo.py
- Note: lambda is a Python keyword. Cannot use lambda as a variable name

Arrival and service times

```
import random

lamb = 2
i1 = random.expovariate(lamb)
i2 = random.expovariate(lamb)
i3 = random.expovariate(lamb)

mu = 1
s1 = random.expovariate(mu)
s2 = random.expovariate(mu)
s3 = random.expovariate(mu)
```

Name ▲	Type	Size	Value
i1	float	1	0.886333566840348
i2	float	1	0.5129872509130181
i3	float	1	0.2597444444294557
lamb	int	1	2
mu	int	1	1
s1	float	1	1.118666003053235
s2	float	1	5.088431468890377
s3	float	1	0.635335569495133

Simulating M/M/1 queue

- In order to test how well our discrete event simulation program works, we will use it to simulate an M/M/1 queue and compare it with the expected result
- An M/M/1 simulation program is given in *sim_mm1.py* (available on the course web site)
- We will:
 - Take a look at the program
 - Run it and make some observations

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Observations from running the simulation

- The mean response time from simulation can be close to (but not equal to) the theoretical mean simulation time
- Each simulation run gives a different mean response time

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Trace driven simulation

- We considered this example in the beginning of this lecture
- We simulated using
 - A sequence (or trace) of arrival times
 - A sequence of service times
- We call this trace driven simulation
- Trace driven simulation is useful
 - You have a server and you have a log of the arrival time and service time of the job
 - You are considering changing to a new server
 - You can use the traces that you have and simulation to calculate the response time of the new server

Customer number	Arrival time	Service time
1	3	4
2	8	3
3	9	4
4	17	6
5	18	3
6	19	2
7	20	2
8	25	3
9	27	2

Trace driven simulation

- An example of trace driven simulation is in the file `sim_1server_trace.py`
 - Note that `sim_1server_trace.py` assumes infinite buffer rather than finite buffer
- Earlier we used random number generators to produce inter-arrival and service time
 - For trace driven simulation, the arrival time and service time are read from the supplied trace
